                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      र्
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SXS
                         The invention relates to a novel composition comprising human papillomavirus (HPV) antigens or portions linked via hydrophobic bonds or mixed with very small size proteoliposomes (VSSP's). The invention further comprises a method for treating a tumor expressing an HPV antigen CC by administering an effective amount of this composition. The novel composition has cytostatic activity. The composition is useful for CC composition has cytostatic activity. The composition is useful for CC suitable for use in the pharmaceutical industry as vaccines in human CC therapeutics for cancer treatment. The cellular immune response against CC therapeutics for cancer treatment. The cellular immune response against CC cytotoxicity, ensuring that cells which exhibit the HPV antigen are CC destroyed more effectively. This sequence represents a Neisseria CC meningitials pl.7.16 delta 5 and HPV-16 E7 fusion protein, used in the CC expression of HPV antigens of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches

                                                                                                                                        The present sequence represents a fusion protein comprising Mycobacterium bovis heat shock protein (Hsp) 65 fused at its C terminal to a HPV16 E7 protein. The fusion protein is used in the method of the invention. The stimulates a Th1-like response. Th1 cells are a subset of CD4+ T lymphocyte cells. The method comprises contacting naive lymphocytes in vitro with a fusion protein comprising at least a fragment of Hsp, and then detecting the TH1-like response exhibited by the cell sample. The proteins which may be used in the method of the invention are Hsp65, Hsp40, Hsp10, Hsp60, and Hsp71. The method may be used to identify compounds that stimulate Th1-like responses in response to microbial

                                                                                                                                                                                                                                                     The present sequence represents a fusion protein comprising Mycobacterium tuberculosis heat shock protein (Hsp) 71 fused to a HPV16 E7 protein. The fusion protein is used in the method of the invention. The specification describes a method of determining whether a compound stimulates a Thilike response. Thi cells are a subset of CD4+ T lymphocyte cells. The method comprises contacting naive lymphocytes in vitro with a fusion protein comprising at least a fragment of Hsp, and then detecting the TH1 like response exhibited by the cell sample. The proteins which may be used in the method of the invention are Hsp65, Hsp40, Hsp10, Hsp60, and Hsp71. The method may be used to identify compounds that stimulate Thilike responses in response to microbial pathogens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Synthetic.

The fusion protein is used in the method of the invention. The stimulates a Th1-like response. Th1 cells are a subset of CD4+ T lymphocyte cells. The method comprises contacting naive lymphocytes in vitro with a fusion protein comprising at least a fragment of Hsp, and then detecting the TH1-like response exhibited by the cell sample. The proteins which may be used in the method of the invention are Hsp65, Hsp40, Hsp10, Hsp60, and Hsp71. The method may be used to identify compounds that stimulate Th1-like responses in response to microbial

                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a new nucleic acid molecule (I) encoding a fusion polypeptide useful as a vaccine composition. (I) comprises a first nucleic acid sequence encoding a first polypeptide or peptide that promotes processing via the Major Histocompatibility Complex (MHC) class I pathway (MHC-I-PP) and/or promotes development or activity of an antigen presenting cell (APC). The second nucleic acid sequence is linked in frame to the first nucleic acid sequence or to a linker nucleic acid sequence and encodes an antigenic polypeptide or peptide. The methods and compositions of the present invention are useful as therapeutic vaccine for cancer and for major viral infections, such as hepatoma and cervical cancer, that cause morbidity and mortality. They can also be used in treating animal diseases, such as equine herpesvirus, bovine viruses, Marek's disease, retroviral and lentiviral diseases and rabies, in the veterinary medicine context. The present sequence represents the human repetitions are represents the human partitions.

                                                                                                                                                                                                                                                                                                                                                                                             á
                                                                                                                                                                                                                                                                                                                                                                 뭉
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a nucleic acid molecule that encodes a fusion CC polypeptide, comprising a first nucleic acid sequence encoding a comprise at least one immunogenicity-potentiating CC polypeptide, optionally, fused in frame with the nucleic acid, a linker nucleic acid encoding a linker peptide, and a nucleic acid that is linked in frame to them, and that encodes an antigenic peptide or polypeptide. CC rist encicled a cid molecule, polypeptides and vectors are useful as conceines for enhancing immune responses, primarily cytotoxic T CC vaccines for enhancing immune responses, primarily cytotoxic T CC antigens, and for inhibiting growth or preventing re-growth of a tumour. CC the packaging cell line is useful for generating alphavirus replicon comparticles without contamination from replicon-competent virus. The packaging cell line is useful for generating alphavirus replicon compatities b virus, hepatitis C virus, human immunodeficiency virus, hepatitis B virus, hepatitis C virus, human immunodeficiency virus, as malaria, and bacteria that grow intracellular parasites such as malaria, and bacteria that grow intracellularly such as mycobacteria conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches

Also described: (1) an expression CC vector comprising (I) operatively linked to a promoter and optionally, to CC one or more regulatory elements that enhance expression of the nucleic CC acid in a cell; (2) a particle comprising (I) or the expression vector; (3) a cell that has been modified to comprise (I) or the expression vector; (2) a cincent polypeptide comprising a first domain with a CC translocation polypeptide; and a second domain comprising an antigen CC capable of inducing or enhancing an antigen specific immune response, CC comprising (I), expression vector, particle, cell, cell of the particle, CC or the chimeric polypeptide; and a carrier or excipient; (6) inducing or enhancing an antigen specific immune response, CC comprising an antigen specific immune response, CC or the chimeric polypeptide; and a carrier or excipient; (6) inducing or CC enhancing an antigen specific immune response by administering the CC composition described above; (7) increasing the number of CDS + CTLs composition described above; and (8) inhibiting the growth of a tumour in CC a subject by administering the composition described above; and subject by administering the CC cytostatic activity, and can be used in immunotherapy, and gene therapy. The present sequence represents HPV-16 E7, which is used in the CC exemplification of the present sequence represents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to nucleic acid encoding a chimeric polypeptide comprising a translocation domain of a bacterial toxin and at least one antigenic peptide. The preferred translocation domain is domain II of Pseudomonas aeruginosa exotoxin A (ETA(dII)) and the preferred antigen is human papilloma virus type 16 (HPV-16) E7 which is a model tumour antigen. The antigenic peptide comprises an epitope that binds to and is presented on the cell surface by major histocompatibility complex (MHC) class I proteins. The nucleic acid of the invention is useful as vaccine composition for enhancing antigen specific immune response, increasing the number of CD8+ cytotoxic T lymphocytes (CTLs) and for inhibiting the growth of a tumour. The present sequence is HPV-16 E7 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       20-OCT-1999;

                                                                                                                                                                                                                                                                                                                         The invention comprises a nucleic acid molecule (DNA vaccine) that encodes a fusion polypeptide which is useful as a vaccine composition. The nucleic acid of the invention contains: a first nucleic acid encoding a polypeptide that promotes processing via the MHC class I pathway; a second sequence encoding a signal peptide; and a third sequence encoding an antigenic polypeptide. The DNA vaccine of the invention is useful for inducing or enhancing an antigen specific immune response, or to inhibit growth or prevent re-growth of a tumor expressing Human papillomavirus (HPV) E7 or E6 protein. The present amino acid sequence represents a human papillomavirus type 16 (HPV16) E7 protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acid molecules encoding a fusion polypeptide comprising an antigen, a signal peptide, and a heat shock protein, useful as a vaccine for inducing or enhancing immune response or for inhibiting or preventing tumor growth.
